USSR RAIL LINE SEARCH FOR ICBM ACTIVITY
11-17 JULY 1964

This report presents the results of a search for ICBM activity along rail lines in the USSR on [redacted] photography from [redacted]. The search was conducted according to the following established criteria:

Examination was made of all stretches of rail line (broad-gage main, branch, and spur lines connected to or a part of the main USSR rail network) which were 8 nautical miles (nm) or more in length and were covered for a distance of 25 nm on both sides by photography of good enough quality to determine with a 95 percent degree of confidence the existence of ICBM complexes with launch areas resembling the soft or the hard launch areas at the Tyuratam Missile Test Center. It should be noted that the above degree of confidence of detection applies only where a support facility, road pattern, and one or more launch areas could be

discerned.

This search has negated, in terms of ICBM activity, approximately 2,550 nm of Soviet rail line and has produced no evidence of ICBM activity that has not been previously reported.

A total of 18 overlays to World Aeronautical Charts showing all rail lines searched with negative results has been prepared. These overlays also show the location of all ICBM launch complexes identified to date and the applicable [redacted] mission pass number on which the lines were covered. Copies of the 18 overlays, which constitute a graphic supplement to this report, have been forwarded to the CIA requester and to the [redacted] control officers of the Army, Navy, Air Force, DIA, and NSA. Further reproduction and dissemination of these overlays to subordinate commands will be the responsibility of the above agencies.
